Better Civic Spaces Together

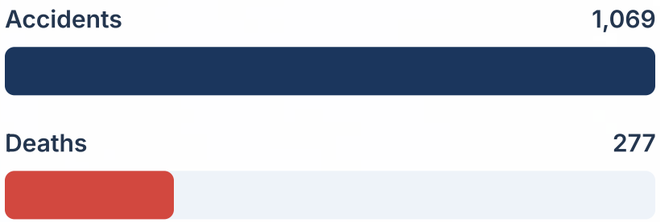

Smarter Cities Stronger Communities

THE PROBLEM, IN NUMBERS

Every unfixed problem has a cost.

Recent public figures from Madhya Pradesh. The issues are known; the response is slow.

POTHOLE ROAD ACCIDENTS, MP 2024

About 1 in 4 pothole accidents was fatal.

Source: figures reported to Parliament (2024).

POTHOLE DEATHS, 5 YEARS

969

Roughly one death every two days.

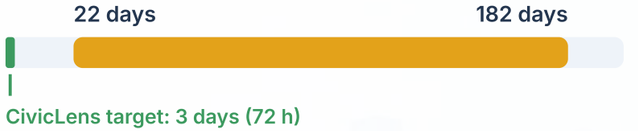

Each dot is a day. Source: MP state data, five-year period.

WATER LEAKS, 16 CORPORATIONS

62,528

leaks detected (March 2026). Time taken to attend to a leak:

Sources: State Urban Administration Dept. (Mar 2026); CAG performance audit, 2013 to 2018 (historical).

OUR SOLUTION

Report once. The right team fixes it first.

Every complaint goes through the same five steps automatically, in seconds.

1

Report

Photo, pin and a few words. Typed or spoken, in Hindi or English.

2

Understand

Claude reads the text and photo: category, severity, safety risk, impact.

3

De-duplicate

Matches the same problem reported nearby, so it becomes one ticket.

4

Prioritise

A 0 to 100 score with a visible breakdown. Most dangerous first.

5

Route

Sent to the team for that category with the most free capacity.

7	EN + HI	2	~20 s
issue categories	voice and text input	tenants: a city and a campus	photo to routed ticket (demo)

FOR CITIZENS

Thirty seconds, no account.

A photo is enough

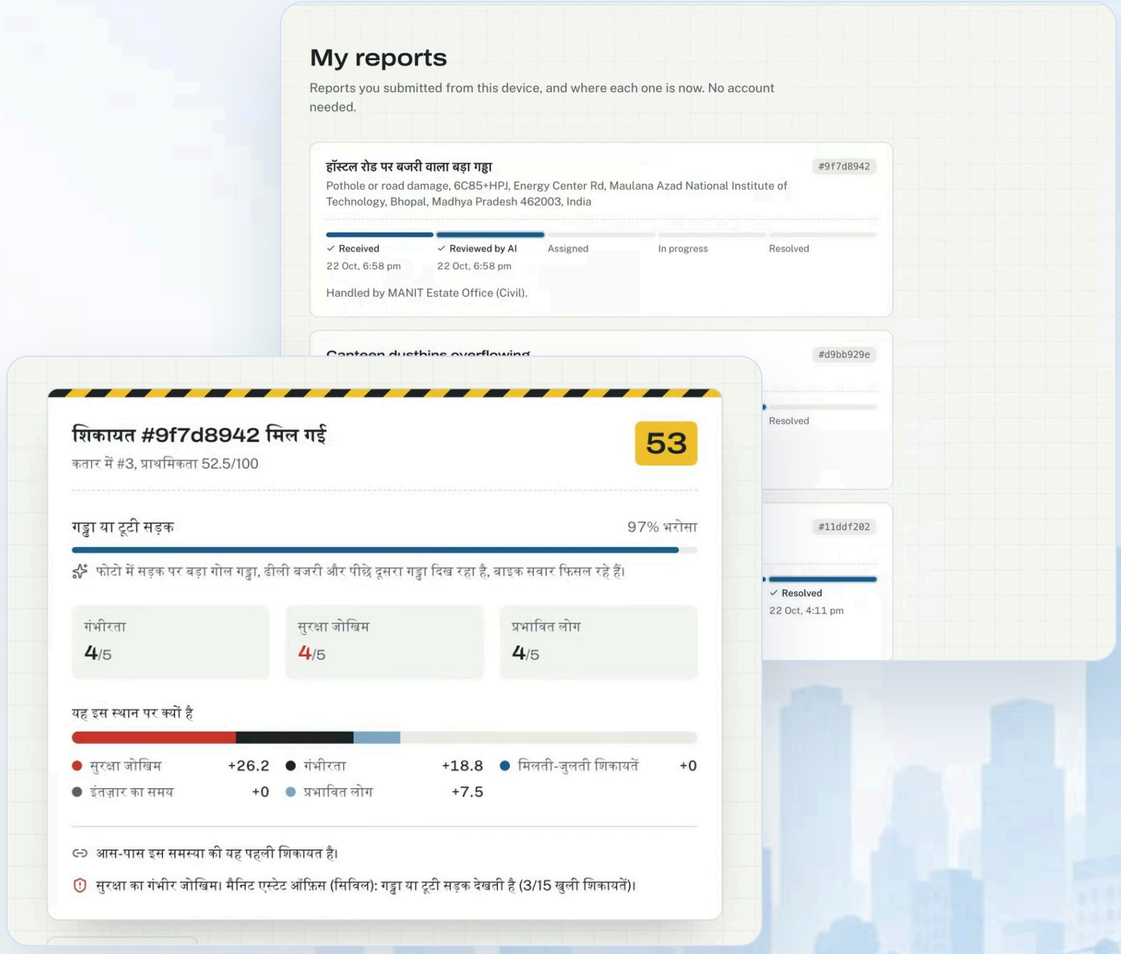

The AI writes the title and picks the category from the picture.

Speak in Hindi or English

Voice typing and a fully translated interface. Hinglish works too.

See what happens next

An instant result card, then a status timeline from received to resolved.

SMART PRIORITISATION

A priority score you can read.

Five factors, fixed weights, shown on every complaint. Nothing is a black box.

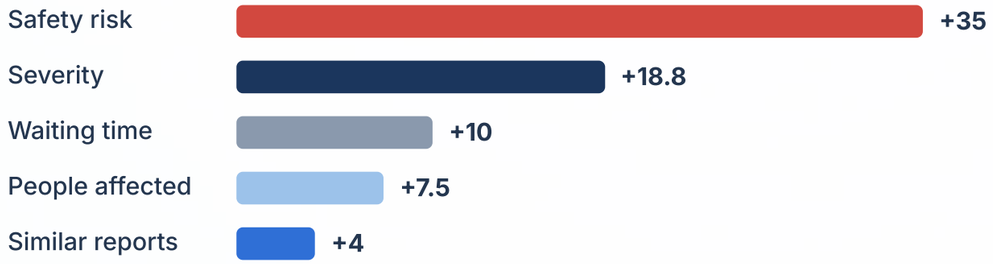

Related reports capped at 5. Waiting time measured against a 72 hour response target.

WORKED EXAMPLE

Huge pothole, MP Nagar Zone 1 road

75

WHAT THE OFFICER READS

"Ranks first at 75.3, mainly because its safety rating is at the maximum. It has also waited past 72 hours."

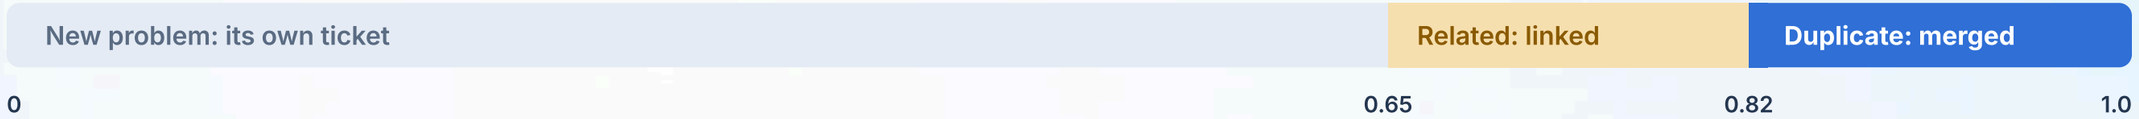

Plain-language reason | Override any score | Audit-logged

DUPLICATE DETECTION

Same pothole, many reports. One ticket.

Each report becomes a meaning vector, so "गड्ढा" and "pothole" land close together.

HOW SIMILAR IS THE NEW REPORT TO AN OPEN ONE?

cosine similarity of 512-dimension text embeddings

75 m
Only reports this close together are compared.

14 days
Older reports count as a new occurrence.

1 org
A city and a campus never mix their queues.

Merged, never deleted
Duplicates add weight to the original's priority. An officer can unmerge in one click.

HOTSPOTS

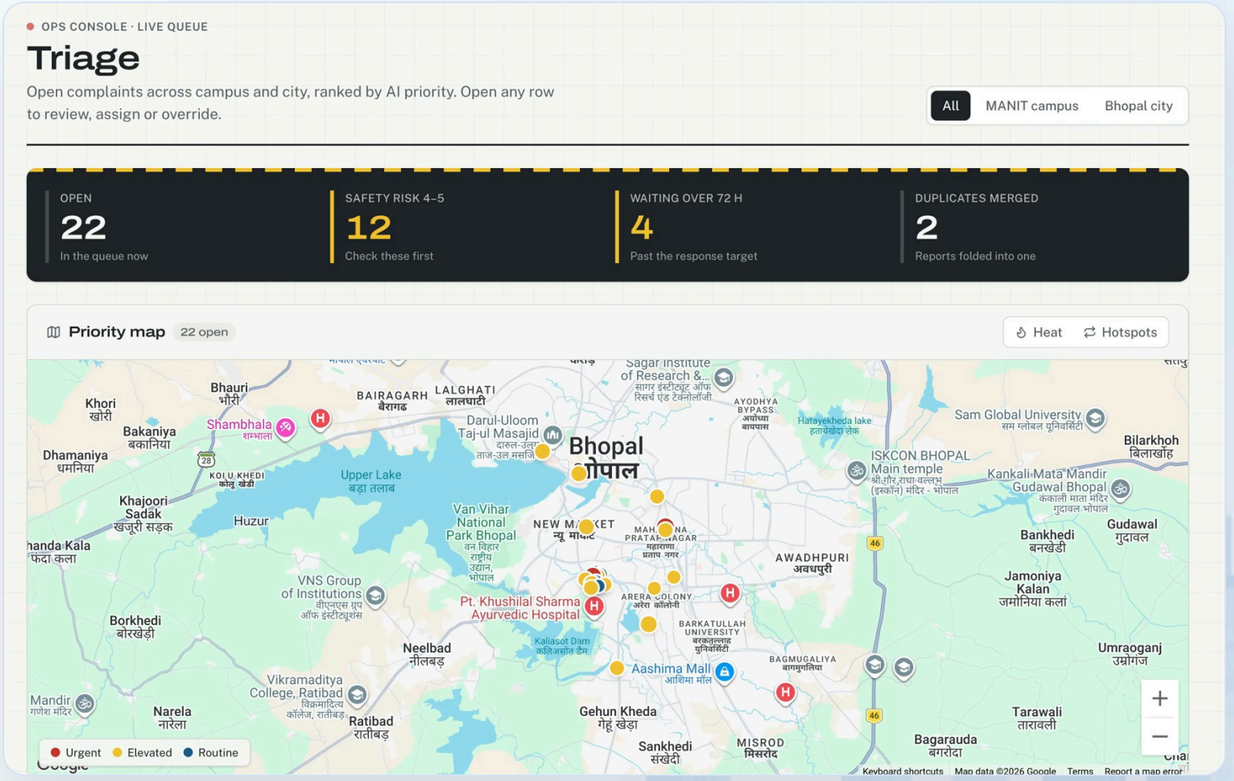

Spot the problems that keep coming back.

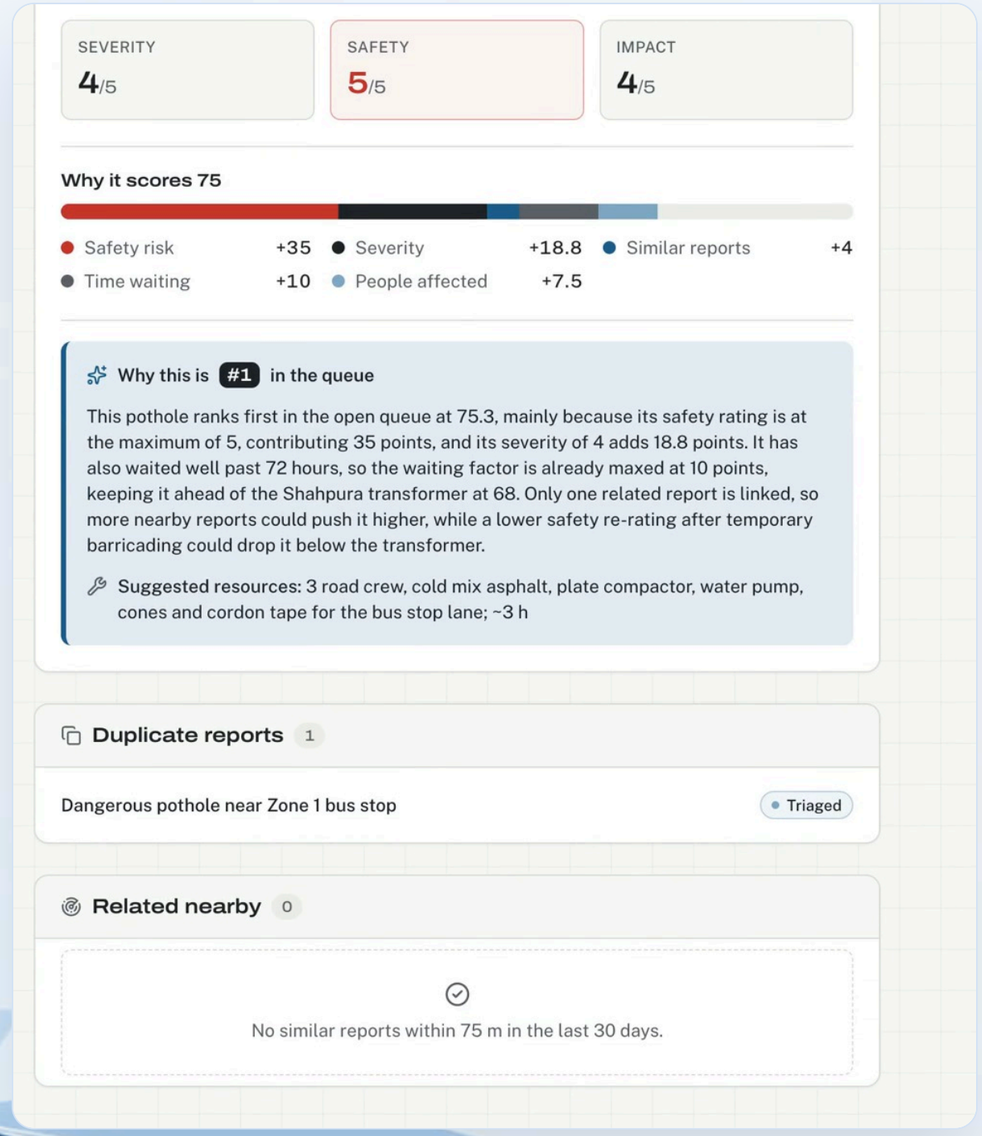

Nearby reports are clustered on the map. A place that keeps getting reports is flagged **Recurring**: a systemic fault, not a one-off.

60 m
cluster radius

3+
reports in 30 days
= Recurring

PostGIS DBSCAN clustering, scoped per organisation.

FOR OFFICERS

Everything needed to act.

Why it ranks here

Score breakdown plus a written explanation and suggested crew.

Merge and unmerge

Fold duplicates into one report, reversibly.

Street View of the spot

See the location before sending a crew.

Override with an audit trail

Change category, status or team. Who, what, when is recorded.

Bulk actions

Update many complaints at once from the triage queue.

ARCHITECTURE

Simple stack, serious pipeline.

If the AI call fails, the complaint is still saved as "other" and flagged for an officer, so no report is lost.

CIVICLENS

Thank you.

From civic complaints to collective action.
